

MANUAL

Predator **X10**

A detailed close-up photograph of an engine's internal components, including valves, springs, and pistons, rendered in a high-contrast, metallic style.

Tools Required

Essential Tools :

1.5, 2.0 & 3.0mm Hex drivers
5.5 & 7.0mm A/F nut spinners
5.5mm & 3/8" A/F open spanners
Long Nosed Pliers
Scalpel

Other Useful Tools :

Metric steel rule
Curved scissors
Miniature circlip pliers (internal)

Additional Materials

Essential Materials :

Silicone Diff Grease
2 Part Epoxy Resin
Thin CA glue (superglue)
Threadlock
Polycarbonate Paints for Bodyshell
Shock Oil

Other Equipment Required :

2 Channel Radio Control
Steering servo & arm
Motor & pinion
Speed Controller
Batteries (7.2v saddle pack)
Tyres/inserts

Ball Joint Assembly

Always insert the balls into the ball joints from the side indicated

Cyno Acrylate
(thin superglue/tyre glue)

Grease

5 min 2-pt epoxy

Threadlock

X1MN (1)
Slipper clutch coupling

X1NN (1)
Slipper clutch pressure plate

X1ON (1)
Slipper clutch adj.nut

X32LN (3)
Disk spring washers

X32LX (1)
73t spur gear Assembly

1a. Slipper Clutch Assembly

Note orientation of Slipper clutch nut and spring washers.

Slipper Clutch Setting :

set-up tip

Your slipper clutch, when correctly adjusted, will absorb sudden shocks from the wheels, which occur when the car lands from a jump or hits a rut in the track surface. The car's stability will be improved and the transmission protected.

Set it as loosely as possible, and yet just tight enough to prevent slipping under full acceleration.

Use a 3/8" open ended spanner to turn the Adjusting Nut.

Turn the adjusting nut by hand until it just touches the spring washers, then tighten another 1 to 2 turns using a 3/8" AF spanner :-

EXTREME EXAMPLES

Rough low grip conditions Run the slipper at its loosest 1 turn preload.

Smooth high grip conditions Run the slipper at its tightest 2 turns preload.

X1HN (2)
Steel pinion gear

T108 (2)
Pinion collar

X1QX (2)
O ring

X12N (2)
6x12x4 flanged bearing

1b

Build 2

X1EN (1)
One way bearing coupling

X29IS (1)
Brake balance collet

Build tip

Clean out excess oil and
replace with diff grease

1c. One way/brake
collet

Then apply small amount
AFTER ASSEMBLY ONLY

FIRST
Press **FIRMLY** together

X1GX (1)

X10 Composite Chassis

X1DN (1)

Propshaft 1-way adaptor

X1BN (1)

Carbon-fibre propshaft

X29JS (3)

RED silicone 'O'Ring

Plus completed items...

Slipper clutch (from step 1a)

Pinions (from 1b)

Brake balance (from step 1c)

set-up tip

Brake Balance

You can adjust the amount of front brakes by moving the 'O'-rings, onto the Propshaft (no Brakes) or into the recess in the Brake Collett for full brakes. The more 'O'-rings that you place in the Brake Collett recess, the more front brakes you will have.

This is a subtle adjustment, even with all 3 'O' Rings on the Brake Collett there is just gentle front Brakes. Testing has proven this range to be the optimum amount of front brake to use.

1d. Propshaft & assembly into chassis

CHECK THE COMPLETE PROPSHAFT ASSEMBLY IN THE CAR BEFORE APPLYING ADHESIVE!

Assemble the propshaft and lower it into the chassis as shown.

Check the "end float" (forwards & backwards movement of the prop shaft). There should be 1.0 - 1.5mm of end float (End float prevents the bearings from binding when the chassis flexes, for example when the car lands from a jump)

Mix a small amount of 2 part epoxy and smear some, inside of the 1-way adaptor & slipper clutch and bond them to the carbon-fibre propshaft.

CAUTION : Keep checking the end float until the epoxy has hardened, because the heat generated from the setting epoxy glue can warm trapped air, causing the Slipper Clutch to move.

END FLOAT MUST BE SET AT 1.0 to 2.0mm

FLAT THIS END

(Allows excess glue & air to escape)

2. Differentials (Build 2)

X2AN (2)
39T Composite crown gear

X2EA (2)
Hardened alloy diff half - short

X2FA (2)
Hardened alloy diff half - long

X2HN (4)
Diff thrust plate

X2IN (4)
Small thrust washer

X2ZX (20)
Ceramic 1/8" ball

X2YX (12)
Ceramic 2mm ball

- (4) 5x8x2.5 bearing
- (2) M2 x12 cap screw
- (2) M2 washer

Apply pure silicone diff grease liberally
(non-abrasive type)

Thrust race

Adjust in
small
increments

Adjust the M2 screw at the centre of the
diff. It should be JUST possible to make
the gear slip.

Check
for
slip

X36AN (2)
Alloy bearing bush - front
(straight)

X36BN (2)
Alloy bearing bush - rear (angled)

X31CN (8)
Diff shim washer
(use as many as required)

Plus completed items...
(2) Differentials (from step 2b)

(4) 10x15x4 bearing

3a. Transmission Installation

Front differential
installation
Note orientation

set-up tip

1 O-ring on brake collet

Rear differential
installation
Note orientation

Shimming the diff

Step 1 - Check endfloat

0.1mm - 0.2 mm

Step 2 - Endfloat adjustment

Add shims here
(diff must still spin freely)

Step 3 - Gear clearance adjustment

Move shims from their position in
step one to here, if necessary, to
achieve a small amount of gear
clearance (similar to a motor
pinion/spur gear clearance)

X31CN

X3AN (1)
Front gearbox top

X3BN (1)
Rear gearbox top

X32FX (1)
Small rear carbon plate

- (6) M3x8 socket button
- (2) M3x20 socket button
- (1) M3x25 socket c/s
- (2) M3 washers

Build tip

After tightening the gearboxes into place, gently tap the differential from one side then the other to bed shims and bushes into position. (eg: use the plastic handle of a screwdriver)

3b. Gearbox tops

X32EX (1)
large rear carbon plate

X18AX (2)
Rear wing mount

X34CN (1)
Anti-roll bar

X4BN (2)
Alloy damper mounting spacer

X18BX (2)
Wing mount washer

- (2) M3x25 socket button
- (2) M3x8 socket button
- (4) M3x10 socket countersunk
- (4) M3 washer
- (2) Body clip

4. Rear Shock Mounts

Build tip

After tightening the screws, loosen them again by about 1 turn
(This will help in Step 6)

X39HX (2)
Upper rear wishbone - graphite

X5BN (2)
Rear rocker arm

X6BN (2)
Long ball joint

X7BX (2)
Hard alloy flanged ball joint ball

- (2) M3x16mm stud
- (4) M3x10 socket countersunk

5a. Upper Rear Wishbone

Screw the socket stud into the wishbone leaving 8-9mm protruding, then screw the long ball joint onto it.

Build tip

TIP : After tightening the rocker (M3x10), run some thin cyano glue around the edges of the Rocker Moulding where it meets the wishbone. This will ensure zero movement.

X5AX (4)

Upper pin mounting bushes

X5BX (2)

Upper rear suspension pins

(4) M3x3 grub screw

(4) M3x4 socket button

(2) M2 washer (if required)

(4) M3 washer

5b. Upper Rear Wishbone

Note : Use M2 washers here if necessary to reduce end float of the wishbone

NOW, tighten grub screws

GRUB SCREWS MUST FACE OUTWARDS AS SHOWN

X39GX (2)
Lower rear wishbone - graphite

X6AX (2)
Anti-roll bar, wishbone pick-up

X6DN (2)
Lower wishbone suspension pin

X36GN (2)
Bullet ball joint

X6BN (4)
Long ball joint

X6FN (2)
Rear toe link - titanium

- (6) Hard alloy ball joint ball
- (1) M5 washer
- (2) M3x12 socket countersunk screw
- (2) M3 washer
- (2) M4x16 Socket stud
- (1) M3x10 socket c/s screw
- (2) M3x6 socket button screw

6. Lower Rear Wishbone

Lastly re-tighten these screws which were left loose in step 4

Racer's tip

When fitting turnbuckles to the car, it is useful to have all right hand threads to the right of the car. This makes trackside adjustment of the car faster and more accurate.

X36HN (2)
Rear upright

X8XN (2)
Rear axle

X7HX (2)
Alloy rear wheel disc spacer

X7DN (2)
X Drive wheel disc

X9XN (2)
Bud drive pin

X7KZ (2)
'Bud' driveshaft

Driveshaft cap (4)

- (2) M3 nyloc nut
- (2) M3x12 socket button screw
- (2) M3x18 socket button screw
- (6) M3 washer
- (2) M3x12 socket countersunk screw
- (2) M4 flanged nylock nut
- (2) 10x15x4 stainless bearing
- (2) M3x4 grub screw
- (2) 6x12x4 flanged stainless bearing

7. Rear Upright Assembly

Set-up tip

For really top performance make sure that the suspension is free enough to fall under its own weight.

For High Grip Tracks (eg: fresh grass / astoturf)
Use the upper holes, for good stability

For Low Grip Tracks (eg: clay / loose surfaces)
Use the lower holes, gives more mid-corner steering.

X39FX (2)
Upper front wishbone graphite.

X32CX (1)
Front pivot pin mounting plate

X36GN (2)
Bullet ball joint

X11GN (2)
M4 pivot pin, threaded

X11GS(2)
3mm pivot pin, gearbox lug

- (2) Hard alloy ball joint ball
- (6) M3 washer
- (6) M4 washer
- (2) M3x8 socket countersunk
- (2) M4x16 Socket stud
- (2) M4 nut

8. Upper Front Wishbone

Press the pivot pin X11GS into the gearbox lug (this should be a tight fit)

Secure the M4 pivots X11GN into the carbon plate with the M4 nuts.

Build tip

After tightening the screws, loosen them again by about 1 turn
(This will help in Step 10)

X9LX (1)
Alloy Steering Arm L

X9RX (1)
Alloy Steering Arm R (for clevis)

X9TX (2)
Delrin steering post x2

X12BN (1)
Carbon steering link

X12ES (2)
Hard alloy threaded balls

X9SX (2)
Steering shoulder screw

- (2) M3 washer
- (4) 5x8x3 flanged bearing
- (4) M2.5x8 countersink screw

9. Steering Assembly

Push the 8 x 4 bearings into the gearbox recesses and attach the alloy steering arms to the car using shoulder screws X9SX.

Slide the carbon link into the chassis c/s side down. Place the Delrin steering posts into the alloy steering arm, and attach them to the carbon link, using M2.5 c/s screws.

X39EX (2)
Lower front wishbone - graphite

X36GN (2)
Bullet ball joint

X6DN (2)
Lower wishbone suspension pin

X6BN (8)
Long ball joint

X14EN (2)
50mm long turnbuckle

X10PX (2)
Push rod

(8) Ball joint ball
(2) M4x16 studs

X14AN (2)
Alloy rocker crank

X14CN (2)
M4 rocker crank pivot shaft

(2) M3 nyloc nut
(4) 4x8x3 flanged bearing
(4) M3x12 socket c/s screw

10. Lower Front Wishbone

Place only 1 ball into each track rod. The other end will clip onto the threaded ball, previously assembled to the steering arms

Once lower suspension pins are in place, Remember to re-tighten these screws which were left loose in step 8.

11. Rocker Cranks

CAUTION - NOTE
ORIENTATION
OF ROCKER CRANKS

X36IN (2)
Front upright

X16XN (2)
"BUD" stub-axle

X9XN (2)
"BUD" drive pin

X15KZ (2)
"BUD" driveshaft

X4DS (4)
Driveshaft cap moulding

X7DN (2)
X Drive wheel disc

X12FS (2)
Pro-track steering pivot

X12EX (2)
Alloy upright top spacer

- (2) 6x12x4 flanged bearing
- (2) 10x15x4 bearing
- (2) M3x4 Grub screw
- (2) M3x15 socket c/s screw
- (2) M3x12 button screw
- (2) M4 flanged nyloc nut
- (2) M3 Nyloc nut

12. Front Upright & Assembly to Chassis

CAUTION: Screw in the Pro-track pivot, until the end of the pivot is about 1mm above the surface of the upright.

The Pro-track steering pivot screw, does not have to tighten. If you screw it too far in, you could crush the wheel bearing and damage it.

X20AN (1)
Motor mount clamp

X20BN (1)
Motor mount disc

X20EN (1)
Motor mount brace tube

- (2) **M3x10** x2 button screw
(to secure motor to disc)
- (2) **M3x8** x2 c/s screws
- (1) **M3x12** button screw
- (1) **M3x8** hex head screw
- (1) **M3x18** button screw

13. Motor Mounting

1. Attach the motor mount brace tube to the small rear shock mount, but do not fully tighten it yet.
2. Now secure the motor mount to the base of the chassis. Secure the brace tube to the motor mount using the M3x12 button screw.
3. Finally ... Tighten the hex headed screw.

M3x10 (steel)

M3x10 (steel)

14. Battery Location

X14AX (4)
Alloy battery post

X14BX (2)
Carbon straps

X14CX (2)
Foam strip for battery straps

- (4) M3x8 c/s screw
- (4) Body clip

Affix foam strip to underside of carbon straps

X9RN (4)
Hard alloy damper body

X9SE (4)
Gold titanium nitrided damper rod

X9DN (2)
Machined piston. 2 hole,
2 groove (rear)

X9ON (2)
Machined piston. 1 hole,
2 groove (front)

X9FN (8)
3mm damper piston circlip (8)

X9HN (4)
White silicone 'O' ring

X6BN (4)
Long ball joint

X9SN (4)
Damper seal housing (4)

X9UN (4)
Volume compensator (4)

X9GN (4)
Large internal circlip

X9IN (4)
Bearing washer

X9PN (4)
9mm dia black O-ring

15. Damper Assembly

Front ONLY
rebound valve

Note orientation

Hold last thread
with side cutters

screw balljoint up
to cutters

Filling The Damper with Oil :

Fill the body with pure silicone oil up to the first thread.

Check set-up sheet for oil weights.

Position the piston rod about halfway in and screw the seal housing/piston rod assembly into the damper body, allowing excess oil to be forced out of the body.

Set-up tip

On low grip tracks front oil weight can be reduced to increase front end grip.

X16AX (4)
Self aligning damper mounting bush

17EN (8)
1mm Ride height "c" clips
17FN (8)
3mm Ride height "c" clips
17GN (8)
5mm Ride height "c" clips

X15AX (2)
Delrin sliding spring platform

X9KN (4)
Spring platform washer

X9LN (4)
Slotted spring retainer

X9QN (2)
'P' springs, Gold (rear)

X9AX (2)
Coil springs, 6.5 turns (front)

X9CX (2)
Coil spring, 5.5 turns (rear)

- (4) M3 Nyloc nut
- (4) M3x12 socket countersunk
- (2) M3x16 stud
- (2) M3x20 stud

16. Mounting the Dampers

TIP : Do not overtighten the M3 nut, which could crush the self aligning damper mounting. The damper must rotate freely around the bush

X25BX (1)

Body shell

X24AX (1)

Front wing

X24CX (1)

Rear wing

X248N (2)

Body side fixing mount

X20AX (1)
